Kosta Tsipis and Alan Cranston include some helpful suggestions ... Kaldor looks at intractable conflicts over "identity politics," which are generally fought with small arms and concern government ...

An incisive account of the Persian Gulf War, Storm Over Iraq shows how the success of Operation Desert Storm was the product of two decades of profound changes in the American approach to defense, military doctrine, and combat operations. The first detailed analysis of why the Gulf War could be fought the way it was, the book examines the planning and preparation for war. Richard P. Hallion argues that the ascendancy of precision air power in warfare—which fulfilled the promise that air power had held for more than seventy-five years—reflects the revolutionary adaptation of a war strategy that targets things rather than people, allowing one to control an opposing nation without destroying it.

Historical Dictionary of Arms Control and Disarmament provides an overview of key themes and issues in international security and arms control, focusing on traditional and nontraditional efforts in the twentieth century to manage the spread and use of armaments and to prevent war. This book summarizes the rich and proud traditions of arms control and disarmament, their crucial role in ensuring a noncatastrophic course of history (especially during the Cold War), and their continuing relevance in the post-Cold War world. It also defines a broad perspective of key terms and captures the scope and range of application yesterday, today, and tomorrow. This dictionary chronicles personalities, events, and agreements and is a ready reference from which to launch a more extensive investigation. It includes a large dictionary of more than 1,000 key terms, a comprehensive bibliography, an extensive chronology, and a timeline. Historical Dictionary of Arms Control and Disarmament also provides information that is comprehensible to all readers. Jeffrey A. Larsen and James M. Smith present a context for the broader range of international relations at a given point in time, extending the utility of the dictionary beyond just a narrow examination of arms control.

This work analyses the vulnerability of America's land-based missile force to a pre-emptive Soviet strike as an issue in US strategic and political debate. It examines why the issue rose to prominence in the way it did in the 1970s and then fell away as a concern in the 1980s without being solved in the way it had been presented. It details the way in which the issue was exploited for political and strategic purposes which were often at odds with a concern for this vulnerability.

The nuclear arms race had dominated international politics for the two decades prior to publication. Originally published in 1975, this symposium examines the dynamics of change within the arms race and the attempts at controlling and limiting it. At the time the nuclear arms race was strongly technologically determined, as Herbert York demonstrates in discussing the impact of MIRV. Such progress as has been made in nuclear disarmament has been far outdistanced by the technological developments so that, as Jack Ruina argues, SALT is only important when seen as part of a process of negotiating arms limitations. The most significant result of this technological advance has been the emergence of a qualitatively new system of international politics which Hans Morgenthau analyses. This system is essentially bipolar in nuclear terms and the history of the disarmament negotiations, as reviewed by William Epstein, is an exercise in freezing this structure. The negotiations themselves, particularly SALT, and the prospects for further progress are discussed extensively by Thomas Schelling, Kosta Tsipis, George Rathjens and others. The book also surveys developments in chemical and biological warfare and includes an important paper on chemical warfare agents by the Soviet chemist, O.A. Ruetov. The final section looks at recent developments in the theory of conflict and its applications in the Middle East, South Africa and a number of developing countries.

The Bulletin of the Atomic Scientists is the premier public resource on scientific and technological developments that impact global security. Founded by Manhattan Project Scientists, the Bulletin's iconic "Doomsday Clock" stimulates solutions for a safer world.

An examination of how, in practice, the effective verification of various arms control treaties - including a comprehensive test ban treaty, conventional forces reductions, a fissile material cut-off and a freeze on the development and production of nuclear weapons - can be achieved.

Outlines present U.S.-Russian naval cooperation and makes suggestions for the future.
