Active Noise Cancellation (ANC) | ams

Active Noise Cancellation (ANC) uses sound to minimize other sounds, you may be thinking that ANC is just a technical term for white noise but actually it is very different as active noise is designed to counteract problem noise-causing both noises to effectively cancel each other out so you don't hear anything.

Active Noise Cancellation: What Is It And How Does It Work ...

Active noise control is sound reduction using a power source. Passive noise control is sound reduction by noise-isolating materials such as insulation, sound-absorbing tiles, or a muffler rather than a power source. Active noise cancelling is best suited for low frequencies.

Active noise cancelling (ANC), on the contrary, uses negative sound waves to actively cancel the noise. This means ANC requires at least three components: Power source. Active noise cancelling (ANC) always requires a power source to detect and analysis noise and then generate a negative wave. Noise detection. Normally, one or more microphones are used to sample the ambient sound.
