Mandated standards used for vehicle airbags, International Organization for Standards (ISO) standards adopted for photographic film, de facto standards for computer software--however they arise, standards play a fundamental role in the global marketplace. Standards, Conformity Assessment, and Trade provides a comprehensive, up-to-date analysis of the link between standards, product testing and certification, and U.S. economic performance. The book includes recommendations for streamlining standards development, increasing the efficiency of product testing and certification, and promoting the success of U.S. exports in world markets. The volume offers a critical examination of organizations involved in standards and identifies the urgent improvements needed in the U.S. system for conformity assessment, in which adherence to standards is assessed and certified. Among other key issues, the book explores the role of government regulation, laboratory accreditation, and the overlapping of multiple quality standards in product development and manufacturing. In one of the first treatments of this subject, Standards, Conformity Assessment, and Trade offers a unique and highly valuable analysis of the impact of standards and

conformity assessment on global trade.

International trade has grown rapidly over the past half century, accommodated by the transportation industry through concomitant growth and technological change. But while the connection between transport and trade flows is clear, the academic literature often looks at these two issues separately. This Handbook is unique in pulling together the key insights of each field while highlighting what we know about their intersection and ideas for future research in this relatively unexamined but growing area of study.

This chapter introduces environmental challenges associated with global trade. It analyzes some impacts of European standards of life on ecosystem services in developing countries. It presents eight case studies (agro-fuels, fishing, flower, palm oil, shrimp and fish farming, soybean, tourism, and tropical timber). For each of these cases, global importance and fluxes are described. The European Union ' s imports or its contributions to global trade are evaluated. The impacts of the production of these food and other agricultural products on ecosystems and biodiversity are assessed in the production countries. The chapter identifies research priorities and suggests policy options for reducing the impacts of global trade on biodiversity and ecosystem services. The possibility of using technical trade barriers based on environmental criteria is explored. The role of a World Environment Organization in implementing an International Environmental Governance is discussed as well as more specific policy options.
