Clustering consists of grouping certain objects that are similar to each other, it can be used to decide if two items are similar or dissimilar in their properties.. In a Data Mining sense, the similarity measure is a distance with dimensions describing object features. That means if the distance among two data points is small then there is a high degree of similarity among the objects

and ...

Introduction to Data Mining (Second Edition)

Data mining is the process of looking at large banks of information to generate new information. Intuitively, you might think that data "mining" refers to the extraction of new data, but this isn't the case; instead, data mining is about extrapolating patterns and new knowledge from the data you've already collected.

Data mining is a rapidly growing field that is concerned with developing techniques to assist managers to make intelligent use of these repositories. A number of successful applications have been reported in areas such as credit rating, fraud detection, database marketing, customer relationship management, and stock market investments.

Data mining is the process of finding anomalies, patterns and correlations within large data sets involving methods at the intersection of machine learning, statistics, and database systems. Since data mining is about finding patterns, the exponential growth of data in the present era is both a boon and a nightmare.
