Logical Design. Database design starts with a conceptual data model and produces a specification of a logical schema; this will determine the specific type of database system (network, relational, object-oriented) that is required. The relational representation is still independent of any specific DBMS; it is another conceptual data model.

Certain principles guide the database design process. The first principle is that duplicate information (also called redundant data) is bad, because it wastes space and increases the likelihood of errors and inconsistencies. The second principle is that the correctness and completeness of information is important.

In the Systems Development Life Cycle (SDLC), the design of the system's processes begins in the detailed systems design phase. In most modern relational DBMSs, a new database implementation requires the creation of special storage-related constructs to house the end-user tables. Nice work! You just studied 47 terms!

database design. Note that some phases are database management system independent and some are dependent. The idea is to design first the database without thinking about the actual database system - just to concentrate on the data. Conceptual Design Once all the requirements have been collected and analyzed, the next step is to create a conceptual schema for the database, using a high level conceptual data model.

Main Phases of Database Design - Assignment Expert

Database design is the organization of data according to a database model. The designer determines what data must be stored and how the data elements interrelate. With this information, they can begin to fit the data to the database model. Database management system manages the data accordingly. Database design involves classifying data and identifying interrelationships. This theoretical representation of the data is called an ontology. The ontology is the theory behind the database's design.
