Markov and Hidden Markov models are engineered to handle data which can be represented as 'sequence' of observations over time.

Hidden Markov models are probabilistic frameworks where the observed data are modeled as a series of outputs generated by one of several (hidden) internal states.

Series. HMM is widely used for data having continuation and extensibility such as time-series health checkup data. Therefore, using HMM as probabilistic model to model the health checkup data is considered to be suitable, and HMM can express the process of health condition changes of a person.

Hidden Markov Model (HMM) is a statistical Markov model in which the system being modeled is assumed to be a Markov process – call it – with unobservable ("hidden") states. HMM assumes that there is another process whose behavior "depends" on . The goal is to learn about by observing . HMM stipulates that, for each time instance , the conditional probability distribution of given the history ...

## **Hidden Markov Models Based Approaches to Long-Term**

A principal method for carrying out regime detection is to use a statistical time series technique known as a Hidden Markov Model. These models are well suited to the task as they involve inference on "hidden" generative processes via "noisy" indirect observations correlated to these processes.
