Jython is the JVM implementation of the Python programming language. It is designed to run on the Java platform. A Jython program can import and use any Java class. Just as Java, Jython program compiles to bytecode. One of the main advantages is that a user interface designed in Python can use GUI elements of AWT, Swing or SWT Package.

Using jythonc A script called jythonc should have been installed in the Jython installation directory when you installed the package. If it was not, it can be invoked as follows: `jython Tools\jythonc\jythonc.py`. The jythonc tool generates actual Java source code, and then invokes a Java compiler over this source code to create the.class files.

You can use the Jython Evaluator processor to read, update, or create record header attributes. Use a map when creating or updating a header attribute. If a header attribute exists, the script updates the value. If it does not exist, the script creates the attribute and sets it to the specified value.

Jython has a known issue with the thread safety of imports. To work around this issue, you can use a system-wide lock available with the Jython Scripting origin to synchronize imports between threads and between pipelines. In your script, acquire the lock, import all needed modules, and then release the lock.
