For more than two decades there has been an increase in the incidence of head injuries caused by gunshot wounds. Gunshot wounds to the head have become a leading cause of traumatic brain injury (TBI) in many urban areas in the U.S. due, in part, to a surge in gang violence and overall homicide rates. Other cases involve suicide and unintentional accidents.

Neurosurgical Treatment for Gunshot Wound Head Trauma

A wound in which the projectile breaches the cranium but does not exit is referred to as a penetrating wound. An injury in which

the projectile passes entirely through the head, leaving both entrance and exit wounds, is referred to as a perforating wound. As noted below, multiple factors determine the extent of damage caused by a gunshot wound.

Neurosurgical Treatment for Gunshot Wound Head Trauma

A closed head wound results from a direct blow to the head where the skull is not cracked open, but there is damage to the brain, because of the contact between the brain and the skull that resulted from the blow. A penetrating wound occurs when a foreign object

Gunshot Wound to the Head - ePainAssist

A head injury is any trauma to the scalp, skull, or brain. The injury may be only a minor bump on the skull or a serious brain injury. Head injury can be either closed or open (penetrating). A closed head injury means you received a hard blow to the head from striking an object, but the object did not break the skull.
