Estimating AI Projects: Rule of Thumb 1. Don't Plan Big Projects Without Credible Benchmarks. Ideally Your Own. No matter what you're promised or the figures indicate, you should embark on big AI projects judiciously. If you're experienced in AI work, you probably have some benchmarks on what's involved. These are the best way of validating large predicted AI project costs.

Estimating AI Project Costs & Timescales: 4 Rules of Thumb ...

INTRODUCTION OF ESTIMATE: Before the commencement of any project, it is necessary to work out the probable cost of construction. This is known as the estimate cost. Accuracy of estimation depends upon the accuracy of drawing, specifications and assumptions. The norms of estimation considered in this chapter are based on practical working experience with projects completed as on February 1, 1998.

Are Programs or People Better for Construction Cost Estimating? From the lists above, it becomes clear that human beings and software applications are highly complementary when it comes to construction cost estimating. Most of the characteristics of a good cost estimator (as in a person) are not available in software, although artificial intelligence may lead to new software capabilities in the future.

The Ultimate Guide to Construction Cost Estimating

The rules of thumb refer to capital cost estimation. 1. Total fixed capital cost estimation, total fixed capital invest-ment = 3 to 10 (4 to 5 usual) q FOB major pieces of equipment. The factor decreases as more alloys are used in the process. 2. For capital cost estimation: for carbon steel fabrication: L+M

A rule of thumb is a principle with a broad application that is not intended to be strictly accurate or reliable for every situation. It is an easily learned and easily applied procedure for approximately calculating or recalling some value or for making some determination (" Rule of Thumb "). It is a simple model.

The Rule of Six-tenths Approximate costs can be obtained if the cost of a similar item of different size or capacity is known. A rule of thumb developed over the years known as the rule of six-tenths gives very satisfactory results when only an approximate cost within plus or minus 20% is required.
